

// CombiSys: A Modular Machine Concept for up to 12,000 Containers per Hour. ///

Following the success of VarioSys® - a production system that combines machine modules with isolators - special machine manufacturer Bausch+Ströbel is launching another system solution: CombiSys. It processes a wide variety of packaging materials on a single platform and reaches a speed of 12,000 containers per hour with 100 percent IPC. A modular design and standardized components cuts down on design and manufacturing hours, reducing the delivery time. Size part changeovers and maintenance have been made much easier because all CombiSys work stations are based on the same working principle. CombiSys requires few size parts and changing over to a different container is straightforward and easily managed. At the moment, CombiSys can process nested RTU syringes, vials or cartridges. In the future, CombiSys will be available for processing bulk containers as well.

Three dosing systems on one machine

Today, flexibility is highly valued not only when it comes to packaging materials, but also with regard to dosing methods. If different drugs with different validated dosing technologies must be processed on one production line, several dosing stations must be provided for from the start; otherwise, the line must be converted. Now, a multi-dosing unit makes it unnecessary to convert the equipment because it contains peristaltic pumps, rotary piston pumps and time/pressure dosing equipment. A central driving system makes the unit compact and space-saving.

CombiSys is the ideal solution for contract manufacturers and drug manufacturers who need greater flexibility and consider the adaptability of their machines a competitive advantage.
